AMA Says Cheerleading Is a Sport so lets get some  
CHEERLEADING CHANTS going for 1 million SWF to become  
MD's...

6-18-14 iApp for the "Serendipity Book Readers" Defensive  
Driving for the InventSomething while reading or "Driving"  
as you must have the "list" of 1,001 Invention Projects on  
your Mind at all times... From allowing our eyes to see, to  
enabling green plants to harvest energy from the sun,  
photochemical reactions - reactions triggered by light - are  
both ubiquitous and critical to nature. Photochemical  
reactions also play essential roles in high technology, from  
the creation of new nanomaterials to the development of  
more efficient solar energy systems. Using photochemical  
reactions to our best advantage requires a deep  
understanding of the interplay between the electrons and  
atomic nuclei within a molecular system after that system  
has been excited by light. A major advance towards  
acquiring this knowledge has been reported by a team of  
researchers with the U.S. Department of Energy (DOE)'s  
Lawrence Berkeley National Laboratory (Berkeley Lab) and

the University of California (UC) Berkeley.

6-18-14 9/11 II and Saudi Arabia with \$777 Trillion in \$4 Gas Revenues financing of the Terrorists is not NY Times News, its attacker in Baghdad Today will do 9/11 II which is "disinformation" to protect the Saudi Terrorists II.

6-18-14 9/11 II... Mossad informed the FBI and CIA in August 2001 that based on its intelligence as many as 200

terrorists were slipping into the United States and planning "a major assault on the United States." The Israeli intelligence agency cautioned the FBI that it had picked up indications of a "large-scale target" in the United States and that Americans would be "very vulnerable." [9] However, "It is not known whether U.S. authorities thought the warning to be credible, or whether it contained enough details to allow counter-terrorism teams to come up with a response," [10] A month later, terrorists struck at the World Trade Center and the Pentagon. [9]

6-18-14 iApp for the "Serendipity Book Readers" Defensive Driving for the InventSomething while reading or "Driving" as you must have the "list" of 1,001 Invention Projects on your Mind at all times... From allowing our eyes to see, to enabling green plants to harvest energy from the sun, photochemical reactions - reactions triggered by light - are both ubiquitous and critical to nature. Photochemical reactions also play essential roles in high technology, from the creation of new nanomaterials to the development of more efficient solar energy systems. Using photochemical

reactions to our best advantage requires a deep understanding of the interplay between the electrons and atomic nuclei within a molecular system after that system has been excited by light. A major advance towards acquiring this knowledge has been reported by a team of researchers with the U.S. Department of Energy (DOE)'s Lawrence Berkeley National Laboratory (Berkeley Lab) and the University of California (UC) Berkeley. Dynamic Spectroscopy Duo: 2D Electronic-Vibrational Spectroscopy Technique Provides Unprecedented Look into Photochemical Reaction From allowing our eyes to see, to enabling green plants to harvest energy from the sun, photochemical reactions - reactions triggered by light - are both ubiquitous and critical to nature. Photochemical reactions also play essential roles in high technology, from the creation of new nanomaterials to the development of more efficient solar energy systems. Using photochemical reactions to our best advantage requires a deep understanding of the interplay between the electrons and atomic nuclei within a molecular system after that system has been excited by light. A major advance towards acquiring this knowledge has been reported by a team of researchers with the U.S. Department of Energy (DOE)'s Lawrence Berkeley National Laboratory (Berkeley Lab) and the University of California (UC) Berkeley. Graham Fleming, UC Berkeley's Vice Chancellor for Research and a faculty senior scientist with Berkeley Lab's Physical Biosciences Division, led the development of a new experimental technique called two-dimensional electronic-vibrational spectroscopy (2D-EV). By combining the advantages of two well-established spectroscopy technologies - 2D-electronic and 2D-infrared - this technique is the first that can be used to simultaneously monitor electronic and molecular dynamics on a femtosecond (millionth of a billionth of a second) time-scale. The results show how the coupling of electronic states and nuclear vibrations affect the outcome of photochemical reactions. "We think that 2D-EV, by providing unprecedented details about photochemical reaction dynamics, has the potential to answer many currently inaccessible questions about photochemical and photobiological systems," says Fleming, a physical chemist and internationally acclaimed leader in spectroscopic studies of events that take place on the femtosecond time-scale. "We anticipate its adoption by leading laboratories across the globe," Fleming is the corresponding author of a paper in the Proceedings of the National Academy of Sciences (PNAS) titled "Correlating the motion of electrons and nuclei with two-dimensional electronic-vibrational spectroscopy." Co-authors are Thomas

Oliver and Nicholas Lewis, both members of Fleming's research group. Fleming and his research group were one of the key developers of 2D electronic spectroscopy (2D-ES), which enables scientists to follow the flow of light-induced excitation energy through molecular systems with femtosecond temporal resolution. Since its introduction in 2007, 2D-ES has become an essential tool for investigating the electronic relaxation and energy transfer dynamics of molecules, molecular systems and nanomaterials following photoexcitation. 2D infrared spectroscopy is the go-to tool for studying nuclear vibrational couplings and ground-state structures of chemical and complex biological systems. "Combining these two techniques into 2D-EV tells us how photoexcitation affects the coupling of electronic and vibrational degrees of freedom," says Oliver. "This coupling is essential to understanding how all molecules, molecular systems and nanomaterials function." In 2D-EV, a sample is sequentially flashed with three femtosecond pulses of laser light. The first two pulses are visible light that create excited electronic states in the sample. The third pulse is mid-infrared light that probes the vibrational quantum state of the excited system. This unique combination of visible excitation and mid-infrared probe pulses enables researchers to correlate the initial electronic absorption of light with the subsequent evolution of nuclear vibrations. "2D-EV's ability to correlate the initial excitation of the electronic-vibrational manifold with the subsequent evolution of high-frequency vibrational modes, which until now have not been explored, opens many potential avenues of fruitful study, especially in systems where electronic-vibrational coupling is important to the functionality of a system," Fleming says. As a demonstration, Oliver, Lewis and Fleming used their 2D-EV spectroscopy technique to study the excited-state relaxation dynamics of DCM dye dissolved in a deuterated solvent. DCM is considered a model "push-pull" emitter - meaning it contains both electron donor and acceptor groups - but with a long-standing question as to how it fluoresces back to the ground energy state. "From 2D-EV spectra, we elucidate a ballistic mechanism on the excited state potential energy surface whereby molecules are almost instantaneously projected uphill in energy toward a transition state between locally excited and charge-transfer states before emission," Oliver says. "The underlying electronic dynamics, which occur on the hundreds of femtoseconds time-scale, drive the far slower ensuing nuclear motions on the excited state potential surface, and serve as an excellent illustration for the unprecedented detail that 2D-EV will afford to photochemical reaction

dynamics." One example of how 2D-EV might be applied is in the study of rhodopsin, the pigment protein in the retina of the eye that is the primary light detector for vision, and carotenoids, the family of pigment proteins, such as chlorophyll, found in green plants and certain bacteria that absorb light for photosynthesis. "The nonradiative energy transfer in rhodopsin and carotenoids is thought to involve the breakdown of one of the most widely used approximations of quantum mechanics, the Born-Oppenheimer approximation, which states that since motion of electrons are far faster than nuclei, as represented by vibrational motion, the nuclei respond to changes in electronic states," Oliver says. "With 2D-EV, we will be able to directly correlate the degrees of electronic and vibrational freedom and track their evolution as a function of time. It's a chicken and egg kind of problem: Do the electrons or nuclei move first? 2D-EV will give us insight into whether or not the Born-Oppenheimer approximation is still valid in these cases." For nanomaterials, 2D-EV should be able to shed much needed light on how the coupling of phonons - atomic soundwaves - with electrons impacts the properties of carbon nanotubes and other nanosystems. 2D-EV can also be used to investigate the barriers to electron transfer between donor and acceptor states in photovoltaic systems. "We are continuing to refine the 2D-EV technology and make it more widely applicable so that it can be used to study lower frequency motions that are of great scientific interest," Oliver says.
