7-15-14 Fiery Campaign by NASA Targets the iPhone for fiery aggressive Start of Star Travel iApps iTunes... The sun is the closest star to the Earth and is the brightest object in the sky. The energy of the sun comes from nuclear reactor where hydrogen nuclei fuse to form helium and release energy. The sun has been burning for about 5 billion years and will continue burning for about 5 billion years. The sun has six layers. The core, the radiative zone where the gasses are under high pressure, the convective zone where heat is transferred to the surface. The sun's surface or photosphere is made up of boiling gasses and has temps of 5500 degrees Celsius. Outside the photosphere is the chromosphere and outside that is the corona. The corona is very hot with a temperature round 1 million degrees Celsius.
