When freed 1,001 Invention Projects on a CD and my web page

8-7-14 Greg posted the story below for Dr. Katrina thinking she will write her Frontal Lobe II Book a little faster. Fastest Brain Wave... now invent a way to make them faster + remember more. Well, Yes I'm well and I think this story if you think serendipity... of Memory you might get a accidental invention. If you read the story below without thinking how can I use this article to invent a pill for total recall then... you know what I mean! thanks.

Medical Xpress – If you ask a neuroscientist what is the fastest spiking neuron, they might respond with the familiar manta: "fast-spiking parvalbumin-positive interneurons"

When freed 1,001 Invention Projects on a CD and my web page

If parvalbumin (a calcium-binding protein found in muscle and synapses) and fast-spiking interneurons. So what then exactly is this protein speed pill?

When freed 1,001 Invention Projects on a CD and my web page

The main deal with these particular interneurons is that whether they are the so-called chandelier cells in the cortex, Purkinje cells in the cerebellum, or basket cells in the hippocampus, they all use the transmitter gaba.

When freed 1,001 Invention Projects on a CD and my web page

The review details the common sense concept that fast neurons need fast parts. Stated another way, a neuron can only be as fast as its slowest link in the signal chain. In the traditional conception, the fastest neuron in the world can only transfer spike-based information as fast and reliably as subsequent vesicle fusions at the synapse can track them. However, if fusion probabilities are only 50 percent at best for spike rates of just a few hz, this idea quickly gets into trouble as spike rates increase. We would expect these fusion probabilities at individual synapses to fall precipitously for rates a hundred times that. As we know from other studies, at least in vitro, it is not too hard to make neurons run out of transmitter.

When freed 1,001 Invention Projects on a CD and my web page

Many of the basket-type parvalbumin cells send out short axons which redundantly envelope the cell bodies of other neurons. Conceivably, at high spike rates, these massive terminations could be activated "round robin" so to speak,

like the rotor inside a distributor cap which fires each piston in sequence. In this way high spike rates could activate different synapses at different times to deliver a more-or-less reliable signal to a particular neuron. Without the synaptic endurance afforded by the elaborate vesicle ribbons and rapid fire cartridges that certain sensory neurons possess, mere interneurons could make due by just using extra wiring. One thing that the authors note, however, is that the majority of parvalbumin interneurons are not just local basket cells. Many send out axons of significant length that branch diffuse regions contacted hundreds of neurons.

When freed 1,001 Invention Projects on a CD and my web page

Researchers have found that the presynapses of these neurons use highly optimized isoforms of standard synaptic proteins and channels. In addition to parvalbumin, they employ synaptotagmin II, which happens to have the fastest calcium binding kinetics out of the 15 or so different varieties of this protein. And it's not just the synapses, these neurons are first class all the way. Only the fastest activating and deactivated calcium and potassium channels from the most elite families are tolerated (for the physiologists, this means none of those pokey L or N type channels). Additionally these neurons have among the highest sodium channel densities found for unmyelinated axons. While they may only be able to send spikes at a relatively modest 1.5 m/s, more importantly, they fire the tightest spikes in the brain.

When freed 1,001 Invention Projects on a CD and my web page

Parvalbumin is more than just calcium kinetics. It is fairly abundant in the tissues where it is found and it happens to be the protein responsible for seafood allergy –and for that matter, frog leg allergy. The parvalbumin (and a few other closely related proteins like troponin) in the fast-contracting muscles of these animals is slightly different from our own. In those afflicted this can provoke a strong IgE antibody reaction. What happens to parvalbumin after it binds calcium is still a bit of a mystery. Similar proteins, like calmodulin for example, undergo conformational changes

after calcium binding to expose hydrophobic methyl groups on its methionine residues. These surfaces bind a wide variety of targets, particularly those that contain amphiphilic helices with complementary hydrophobic domains. In parvalbumin interneuron synapses, it has been found that release only need a few calcium channels to operate. The local positions and conformations of parvalbumin and other associated proteins may be critical here. Rather than some fluid Brownian machine, we might imagine what we have here, can be better likened to a geared and well-oiled mechanism.

When freed 1,001 Invention Projects on a CD and my web page

Just how fast are these neurons? That depends. In the absence of the famed oscillatory behavior in the hippocampus, these cells only put out spikes at around 6 Hz. During theta rhythm (4-10Hz) they might jump up to 20 Hz, while during gamma rhythm and sharp wave ripple, they fire over 120 Hz. That is certainly below the single millisecond scale bursts of an auditory neuron, but still not too shabby.

When freed 1,001 Invention Projects on a CD and my web page

Hot rodders know the fastest car is not the one with the biggest engine or most expensive components. It is the one whose parts work best together. As in racing, swapping out stock proteins for racing proteins is just the first step—they must then be tuned together in an evolutionary trial and error. Parvalbumin is likely just one of many components that must work smoothly together for maximal performance.

GE's New SIGNA PET/MR with Time-of-Flight Tech Under Review by FDA

by EDITORS on Aug 5, 2014

GE Healthcare has announced that its new SIGNA PET/MR combination scanner is currently pending FDA clearance. The device performs both the MR and PET scans at the same time, allowing accurate mapping of images from the two modalities. The PET component features a new digital detector and time-of-flight (TOF) technology that detects coincident pairs photons and the timing between them, leading to accurate identification of PET signal location, lower signal-to-noise ratio, and greater image detail.

St. Jude Children's Research Hospital scientists have discovered an enzyme that regulates production of the toxins that contribute to potentially life-threatening Staphylococcus aureus infections. The study recently appeared in the scientific journal the Proceedings of the National Academy of Sciences (PNAS).

Evaluate paying Medical Students vs evaluating the quality of training of the mercenary army of Afghanistan.

When freed 1,001 Invention Projects on a CD and my web page Evaluate paying Medical Students vs evaluating the quality

of training of the mercenary army of Afghanistan. Researchers also showed that the same enzyme allows Staphylococcus aureus to use fatty acids acquired from the infected individual to make the membrane that bacteria need to grow and flourish. The results provide a promising focus for efforts to develop a much-needed new class of antibiotics to combat staph and other Gram-positive infections. Staphylococcus aureus is the most common cause of staph infections, including methicillin-resistant Staphylococcus aureus (MRSA), the drug-resistant infection that is a growing problem in hospitals.
