Yale Daily Student News put a link to the University Web
Page and found Yale Professor Jan and a new iPhone case...
well Professor Jan never came to Key West, otherwise Yale lab
would have invented a glass beer bottle 50 times stronger
than steel; 1 trillion times stronger than the concrete bike
paths in Key West... a "Real World" invention as the Student
News would write up... Out in the Real World those calling
the Shots in Key West have been breaking glass beer bottles
on the Key West bike path since I got here on March, 4 2011
and of course they all had on Coors T shirts to make sure
they got credit. 100's last week were broken on the Navy Dock.
Every square inch for 100 yards by 50 yards had broken glass
and yes I got 2 flats. 100's of tourists with dogs + kids walked
this dock every night for the sunset too. Yes I saw one road
bike get a flat just biking half way down the dock. No, the
little kids in bare feet didn't leave a trail of blood...

10-21-2015 Nightly News From Key West with Greg + Wives... 4 MD Wives Coup D'Etat Review: About 90% of the time sciatica is due to a spinal disc herniation pressing on one of the lumbar or sacral nerve roots. Other problems that may result in sciatica include spondylolisthesis, spinal stenosis,

piriformis syndrome, pelvic tumors, and compression by a baby's head during pregnancy. The straight-leg-raising test is often helpful in diagnosis. The test is positive if, when the leg is raised while a person is lying on their back, pain shoots below the knee. [2] In most cases medical imaging is not needed. Exceptions to this are when bowel or bladder function is affected, there is significant loss of feeling or weakness, symptoms are long standing, or there is a concern of a tumor or infection. Conditions that may present similarly are diseases of the hip and early herpes zoster before the rash appears

10-21-2015 Nightly News From Key West with Greg + Wives... 4 MD Wives Coup D'Etat Review: New Jersey schools gave a new set of harder tests aligned to the Common Core standards last school year and, when the state released the results on Tuesday, they were unsurprising: Fewer students passed. The tests were given to students statewide in third through 11th grades in English, and to roughly the same group in math, with math exams after eighth grade given by subject, like Algebra I and Geometry. Less than half of the students scored as proficient at every level on the math tests; in English, the highest passing rate was 52 percent, in seventh and eighth grades. In most other grades, less than half of the students scored as proficient. "This first year's results show there is still much work to be done in ensuring all of our students are fully prepared for the 21st-century demands of college and career,"

10-21-2015 Nightly News From Key West with Greg + Wives... 4 MD Wives Coup D'Etat Review: Just for fun read this....

Exciting Breakthrough in 2D Lasers: Berkeley Lab Researchers Demonstrate Atomically Thin Excitonic Laser.

An important step towards next-generation ultra-compact photonic and optoelectronic devices has been taken with the realization of a two-dimensional excitonic laser. Scientists with the U.S. Department of Energy (DOE)'s Lawrence Berkeley National Laboratory (Berkeley Lab) embedded a monolayer of tungsten disulfide into a special microdisk resonator to achieve bright excitonic lasing at visible light wavelengths.

"Our observation of high-quality excitonic lasing from a single molecular layer of tungsten disulfide marks a major step towards two-dimensional on-chip optoelectronics for high-performance optical communication and computing applications," says Xiang Zhang, director of Berkeley Lab's Materials Sciences Division and the leader of this study.

Zhang, who also holds the Ernest S. Kuh Endowed Chair at the University of California (UC) Berkeley and is a member of the Kavli Energy NanoSciences Institute at Berkeley (Kavli ENSI), is the corresponding author of a paper describing this research in the journal Nature Photonics. The paper is titled "Monolayer excitonic laser." The lead authors are Yu Ye and Zi Jing Wong, members of Zhang's research group, plus Xiufang Lu, Xingjie Ni, Hanyu Zhu, Xianhui Chen and Yuan Wang

Among the most talked about class of materials in the world of nanotechnology today are two-dimensional (2D) transition metal dichalcogenides (TMDCs). These 2D semiconductors offer superior energy efficiency and conduct electrons much faster than silicon. Furthermore, unlike graphene, the other highly touted 2D semiconductor, TMDCs have natural bandgaps that allow their electrical conductance to be switched "on and off," making them more device-ready than graphene. Tungsten disulfide in a single molecular layer is widely regarded as one of the most promising TMDCs for photonic and optoelectronic applications. However, until now, coherent light emission, or lasing, considered essential for "on-chip" applications, had not been realized in this material.

"TMDCs have shown exceptionally strong light-matter interactions that result in extraordinary excitonic properties," Zhang says. "These properties arise from the quantum confinement and crystal symmetry effect on the electronic band structure as the material is thinned down to a monolayer. However, for 2D lasing, the design and fabrication of microcavities that provide a high optical mode confinement factor and high quality, or Q, factor is required."

In a previous study, Zhang and his research group had developed a "whispering gallery microcavity" for plasmons, electromagnetic waves that roll across the surfaces of metals. Based on the principle behind whispering galleries - where words spoken softly beneath a domed ceiling can be clearly heard on the opposite side of the chamber - this micro-sized metallic cavity for plasmons strengthened and greatly

enhanced the Q factor of light emissions. In this new study, Zhang and his group were able to adapt this microcavity technology from plasmons to excitons - photoexcited electrons/hole pairs within a single layer of molecules.

"For our excitonic laser, we dropped the metal coating and designed a microdisk resonator that supports a dielectric whispering gallery mode rather than a plasmonic mode, and gives us a high Q factor with low power consumption," says co-lead author Ye. "When a monolayer of tungsten disulfide - serving as the gain medium - is sandwiched between the two dielectric layers of the resonator, we create the potential for ultralow-threshold lasing."

In addition to its photonic and optoelectronic applications, this 2D excitonic laser technology also has potential for valleytronic applications, in which digital information is encoded in the spin and momentum of an electron moving through a crystal lattice as a wave with energy peaks and valleys. Valleytronics is seen as an alternative to spintronics for quantum computing.

"TMDCs such as tungsten disulfide provide unique access to spin and valley degrees of freedom," says co-lead author Wong. "Selective excitation of the carrier population in one set of two distinct valleys can further lead to lasing in the confined valley, paving the way for easily-tunable circularly polarized lasers. The demand for circularly polarized coherent light sources is high, ranging from three-dimensional displays to effective spin sources in spintronics, and information carriers in quantum computation."
